Objectives

Understanding the Need for Styling React Components

Styling makes React components visually appealing, improves user experience, and helps organize the layout of the application. React supports multiple styling approaches, allowing developers to create responsive and maintainable user interfaces.

Working with CSS Modules and Inline Styles

CSS Modules provide locally scoped CSS, preventing class name conflicts by applying styles only to the component in which they are imported. **Inline styles** are written directly in JSX as JavaScript objects and are useful for applying dynamic styles, such as changing colors or fonts based on component state or props.
