

QUESTION – QUICK EXAMPLE OF SPRING JPA

//Entity created

@Entity

public class Student {

 @Id

 private int id;

 private String name;

}

//Repository

public interface StudentRepository extends JpaRepository<Student, Integer> {

}

// Save Data

repo.save(new Student(1, "Priyanka"));

//Fetch data

repo.findAll();

In this example, the Student class is mapped to a database table using @Entity. The StudentRepository extends JpaRepository, which provides built-in CRUD methods. The save() method stores the student details in the database, and findAll() retrieves and displays all student records.
